Nuclear Fuel Cycle Overview Training

**Course Description**

- This training seeks to deepen understanding of the definition and role of the nuclear fuel cycle both historically and in the present day.
- The offering has tailored modules for managers as well as for scientists, technicians, and engineers (STEs) who work in nuclear proliferation-sensitive settings around the globe.
- Components of the nuclear fuel cycle are introduced and discussed in depth.
- Curricula encourages engagement in peer-to-peer discussion.
- Instruction is in the form of interactive classroom lectures.
- Course Duration: 1 day

**Nuclear Fuel Cycle**

The nuclear fuel cycle is a complex entity, with many stages and possibilities, encompassing natural resources, energy, science, commerce, and security, involving a host of nations around the world.

The nuclear fuel cycle concerns the life of nuclear material:
- extraction from the earth in raw form
- processing and enrichment
- use in reactors or weapons
- reprocessing or disposal

The basic fuel material for the generation of nuclear power is uranium (and to a lesser extent thorium), however, these materials change chemically and at the nuclear level throughout the fuel cycle.
