Our arbitrary decision to let $c$ represent the mass fraction of the *lighter* component was very unfortunate, because it caused $k_T$ to be *negative* for typical gas mixtures such as He–Ar, in contradiction to the sign convention for $k_T$ used in most publications and in our own numerical examples. Hence, for consistency within this paper and with most publications: In the third paragraph of Sec. II and the first two paragraphs of Sec. IV, the words “lighter” and “heavier” should be interchanged, and “lower” should be “higher.” Subscripts $H$ and $L$ should be interchanged in and near Eqs. (39), (40), (43), (44), and (52). [Equations (41), (42), and (45) are unchanged because $n_H = 1 - n_L$.]
